

API Test Report

WorkForcePro — Workforce Management & OJT Platform
API Testing using Postman

Project	WorkForcePro Workforce Management & OJT Platform
Document	API Test Report
Tool	Postman Collection
Requests	10 (5 positive, 5 negative)
Validation	Status codes, response structure, required fields, business rules
Execution Status	Implemented; not executed (no live environment provided)
Date	27 June 2026

About this report

The report has three parts, as requested: Coverage, Findings and Risks.

1. Coverage

All 7 endpoints are exercised by the 10 requests. The table lists each request, what it checks and the response it expects.

Type	Request	What it checks	Expected	Status	Related
Positive	1. Create Employee	Create a new employee	201 + employee object	Not Executed	-
Positive	2. Retrieve Employee	Get the employee by id	200 + matching record	Not Executed	-
Positive	3. Assign Training	Assign a module with a due date	201 + status 'Assigned'	Not Executed	-
Positive	4. Complete Training	Mark training complete	200 + status 'Pending Approval'	Not Executed	DEF-002
Positive	5. Approve Training	Supervisor approves	200 + status 'Completed'	Not Executed	DEF-002
Negative	1. Duplicate Email	Reuse an existing email	409 rejected	Not Executed	-
Negative	2. Missing Employee ID	Create without Employee ID	400 rejected	Not Executed	-
Negative	3. Invalid Training ID	Assign a non-existent module	404 / 422 rejected	Not Executed	-
Negative	4. Approve Non-Completed	Approve an 'Assigned' training	409 / 422 rejected	Not Executed	-
Negative	5. Complete Unassigned	Complete a training not yours	403 / 422 rejected	Not Executed	DEF-003

Each request validates four things: the HTTP **status code**, the **response structure**, the **required fields**, and the relevant **business rule** (for example, that a completed training must wait for approval).

2. Findings

Eight of the ten requests are expected to pass. Two point to real problems (to be confirmed on execution):

Finding 1 - Completed training is not sent for approval **[Critical · DEF-002]**

The 'Complete Training' request expects the status to become 'Pending Approval'. Analysis of the design indicates it becomes 'Completed' instead, skipping the supervisor approval step. Because nothing then waits for approval, the 'Approve Training' request has nothing to approve, so it cannot pass either.

Finding 2 - An employee can complete a training that is not theirs [High · DEF-003]

The 'Complete Unassigned Training' request expects a rejection (403/422). Analysis indicates the endpoint accepts it and records a completion, because it does not check that the training belongs to the employee.

Note: the 'Duplicate Email' negative test (exact match) is expected to pass. A related, deeper issue - duplicates that differ only by letter case (DEF-001) - is documented in the Defect Report.

3. Risks

#	Risk	Description	Rating
R1	Compliance data can be wrong	If training is auto-completed (Finding 1) or completed by the wrong person (Finding 2), compliance reports cannot be trusted.	High
R2	Rules not enforced on the server	Some rules may be enforced only in the screen, not in the API, so a direct API call can bypass them.	High
R3	Duplicate records	Email and Employee ID uniqueness gaps (see Defect Report) can create two records for one person.	Medium

How to run the tests

```
# In Postman: import the collection, set baseUrl + the three tokens, Run. # Or from the command line: newman run WorkForcePro_API_Tests.postman_collection.json \ --env-var baseUrl=https://<your-env> --env-var adminToken=<jwt> \ --env-var supervisorToken=<jwt> --env-var employeeToken=<jwt>2
```
