

AccessibilityTesting Report

Accessibility Testing | SauceDemo (SwagLabs)

Application	SauceDemo (Swag Labs) — https://www.saucedemo.com
Pages Tested	Login Page; Product Listing Page
Standard Referenced	WCAG2.1 (Levels A & AA)

1. Objective

The purpose of this assessment is to identify real, reproducible accessibility issues on the SauceDemo (Swag Labs) application and evaluate how well it supports users who rely on assistive technology. Testing focused on the Login page and the Product Listing page across five areas: keyboard accessibility, form accessibility, visual accessibility, screen reader considerations, and usability barriers.

2. Testing Methodology

The assessment combined manual testing with browser-based inspection tools:

- Manual keyboard-only navigation using Tab, Shift + Tab, Enter and Space to verify reachability, focus order and focus visibility.
- Chrome DevTools (DOM and accessibility-tree inspection) to check roles, names and label associations.
- Chrome Lighthouse accessibility audit for structural and contrast flags.
- Browser accessibility inspection to confirm how controls are exposed to assistive technology.

3. Accessibility Findings

Severity guide: High = blocks or severely impairs a task • Medium = task possible but with friction • Low = minor inconvenience.

Issue ID	Accessibility Area	Description	Severity	User Impact	Recommendation
ACC-001	Form Accessibility (Login Page)	The Username and Password input fields do not have associated <label> elements. They rely only on placeholder text, which disappears once the user starts typing.	High	Screen reader users may not know the purpose of each input field, and users with cognitive impairments can lose context while entering data.	Add visible <label> elements associated with each input using the for attribute, or provide aria-label/aria-labelledby. Keep placeholders only as supplementary guidance.
ACC-002	Form Accessibility (Login Page)	When an invalid login is submitted, an error message is displayed visually, but the error container has no role="alert" or aria-live. The invalid fields also lack aria-invalid and are not linked to the error message using aria-describedby.	High	Screen reader users may not be informed that the login failed or understand which fields contain errors unless they manually navigate back to the error message.	Add role="alert" or aria-live="assertive" to the error container. Apply aria-invalid="true" to invalid fields and associate the message using aria-describedby.
ACC-003	Keyboard Accessibility	All interactive elements are reachable using Tab and Shift + Tab in a logical order. However, the keyboard focus indicator on the Username and Password fields is missing or not clearly visible.	Medium	Keyboard-only users and users with low vision may lose track of which field currently has focus while navigating the page.	Provide a high-contrast visible focus indicator (such as a 2px outline or box-shadow) for all interactive elements.
ACC-004	Screen Reader Considerations	On the Product Listing page, the page title "Products" is implemented using a element instead of a semantic heading such as <h1>.	Medium	Screen reader users commonly navigate webpages using headings. Without a proper <h1>, understanding the page structure becomes more difficult.	Replace the element with a semantic <h1> heading.
ACC-005	Form Accessibility / Screen Reader	The product sorting dropdown (select.product_sort_container) does not have an associated label. Lighthouse also identifies this as an accessibility issue.	Medium	Screen reader users may hear only the selected value (e.g., "Price High to Low") without knowing that the control is used to sort products.	Associate a visible <label> with the dropdown or provide an aria-label such as " Sort Products ".
ACC-006	Screen Reader Considerations	The Product Listing page does not contain a semantic <main> landmark, as confirmed by the Lighthouse accessibility audit.	Medium	Screen reader users often navigate webpages using landmarks. Without a <main> landmark, locating the primary page content becomes more difficult.	Wrap the primary page content inside a semantic <main> element.

ACC-007	Usability Barrier	The Login button remains enabled even when both the Username and Password fields are empty. Users receive validation only after submitting the form.	Low	Users may repeatedly submit incomplete forms, causing unnecessary errors. This particularly affects users with cognitive impairments or those unfamiliar with the application.	Disable the Login button until the required fields are completed, or provide real-time inline validation indicating which fields are required.
ACC-008	Usability Barrier	After a successful login, pressing the browser Back button returns the user to the Login page instead of redirecting them to the authenticated Products page.	Low	Users may mistakenly believe they have been logged out, causing confusion about whether their session is still active.	Prevent authenticated users from accessing cached login pages, or automatically redirect them to the Products page when a valid session exists

4. Accessibility Testing Summary

Focus Area	Findings	Result
Keyboard Accessibility	Tab and Shift + Tab navigation follow a logical order, and all interactive elements are accessible without using a mouse. However, the keyboard focus indicator on the Username and Password fields is missing or not clearly visible, making it difficult for keyboard users to identify the currently focused field.	Partially Passed
Form Accessibility (Login Page)	The Username and Password fields do not have associated <label> elements and rely only on placeholder text. Additionally, validation messages are displayed visually but are not fully announced to assistive technologies due to missing ARIA attributes.	Failed
Visual Accessibility	The focus indicator on the login form has insufficient visibility, making it difficult for keyboard-only and low-vision users to determine which field currently has focus.	Needs Improvement
Screen Reader Considerations	The Product Listing page uses a element instead of a semantic <h1> for the page title. The product sorting dropdown does not have an associated label, and the page is missing a semantic <main> landmark, reducing navigation efficiency for screen reader users.	Needs Improvement
Usability Barriers	The Login button remains enabled even when required fields are empty, allowing unnecessary form submissions. Additionally, after a successful login, pressing the browser's Back button returns the user to the Login page instead of redirecting them to the authenticated Products page, which may confuse users.	Needs Improvement

5. Overall Assessment

The application provides a logical keyboard navigation order and a generally usable interface. However, several improvements are needed to better support screen reader users, keyboard-only users, and users with cognitive or visual impairments. The highest-priority issues are missing form labels, inaccessible error handling, and insufficient semantic HTML structure. Addressing these issues will improve WCAG compliance and the overall user experience.

OVERALL ACCESSIBILITY STATUS

Moderate – Requires Improvement

Severity	Number of Issues
High	2
Medium	4
Low	2
